

# AMPLFY — Project Part 1

## Website Name

AMPLFY

## Website Description

AMPLFY is a web application that allows users to invest in underground music artists in a way that resembles a stock market. Fans can discover emerging artists early, invest in them using virtual shares, and track how an artist's value grows over time. The platform helps underground artists raise funding, gain exposure, and build a stronger connection with their supporters. Users are able to manage their investment portfolio while staying up to date with new artists joining the platform. AMPLFY blends music, community, and financial strategy into a single interactive experience.

## Website Pages

1) Home – The landing page that introduces AMPLFY, highlights featured artists, and explains how investing works. 2) Market – Displays the full market of underground artists with current prices, trends, and sorting options. 3) Invest – Allows users to invest in specific artists, view price history, and confirm transactions. 4) New Artists – Shows artists who have recently joined AMPLFY, including a short “About Me” section. 5) Profile – Displays the user's portfolio, investment history, balance, and personal account details. 6) About Us – Explains the purpose of AMPLFY, the mission behind the platform, and future goals.

## Client-Side JavaScript Features

Client-side JavaScript will be used to make AMPLFY interactive and engaging. Market charts will dynamically update to show artist price history and trends. Investment forms will include real-time validation to ensure users enter valid amounts before submitting. A slideshow or lightbox will be used to display artist images, music previews, or media. Interactive notifications will alert users when an investment is successful or when an artist's value changes. JavaScript will also be used to update the user's portfolio without refreshing the page.

## Data Storage, Manipulation, and Viewing

AMPLFY will store persistent data on a secure server-side database. User data will include usernames, emails, encrypted passwords, profile information, and investment portfolios. Artist data will include artist name, stage name, profile image, short biography, date joined, total shares available, and current market value. Investment data will track which users invested in which artists, the number of shares owned, purchase price, and transaction history. Only administrators will be able to approve artists, edit artist profiles, or remove artists from the market. Users will only be able to view artists, invest in them, and manage their own profiles. The data will be manipulated when users buy or sell shares, updating both the market values and user portfolios. Users will be able to view their data through dashboards, market tables, and profile pages that pull information directly from the database.
